A Effect of Common, Meetings-Only Treatment

This appendix provides estimates of the effect of the basic information treatment relative to the pure control group. This effect is captured by $-\beta_0$ in Equation 1 in the main text, reproduced here for convenience:

$$y_{gv} = \beta_1 \text{Incent}_v + \beta_2 \text{Cert}_v + \beta_3 \text{Priv}_v + \beta_4 \text{Publ}_v + \delta y_{0gv} + \gamma \text{ShareLandless}_{gv} + \beta_0 \text{PureControl}_v + \varphi_u + \varepsilon_{gv} \quad (1)$$

In each table, estimates of short-term effects are presented in columns (1) and (2), with medium-term effects in columns (3) and (4). The meetings-only treatment has null effects on nearly all of our main outcomes of interest in both the short and medium term. The one exception is the economically large and borderline statistically significant ($p < 0.10$) effect on household self-reported open defecation in the medium term (Table A6). However, note that this is not reflected in the surveyor assessment of open defecation in the same period (Table A5), nor in any of the endline measures of access or ownership (Tables A1, A2, A3, A4), and so this seems likely to be the result of social desirability bias rather than a true change in behavior.

Table A1: Hygienic Latrine Ownership

	Short term		Medium term	
	(1)	(2)	(3)	(4)
Meetings Only	-0.015 (0.041)	-0.014 (0.023)	-0.025 (0.034)	-0.025 (0.021)
	[-0.075, 0.113]	[-0.041, 0.071]	[-0.047, 0.103]	[-0.020, 0.071]
Baseline share owning hyg. lat.		0.709*** (0.022)		0.513*** (0.036)
Share of households landless		-0.083*** (0.017)		-0.089*** (0.032)
Union FEs	Yes	Yes	Yes	Yes
Number of groups	377	376	377	376
Number of villages	31	31	31	31
Omitted category mean	0.399	0.401	0.540	0.543
Omitted category S.D.	(0.240)	(0.240)	(0.249)	(0.247)

Notes: the dependent variable is the share of households in the group owning a hygienic latrine. Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment). Observations (groups) are weighted by the number of households. The sample consists of all villages. This table presents only the effect of the meetings-only treatment relative to pure controls; effects of the other treatments are reported in the main text. The sample sizes reported here are groups and villages in the meetings-only treatment and pure controls. The omitted category consists of groups in pure control villages. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

Table A2: Hygienic Latrine Access

	Short term		Medium term

Omitted category S.D.	(0.208)	(0.208)	(0.153)	(0.153)

Notes: the dependent variable is the share of households in the group with access to any latrine. Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment). Observations (groups) are weighted by the number of households. The sample consists of all villages. This table presents only the effect of the meetings-only treatment relative to pure controls; effects of the other treatments are reported in the main text. The sample sizes reported here are groups and villages in the meetings-only treatment and pure controls. The omitted category consists of groups in pure control villages. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

Table A5: Open Defecation – Surveyor Assessment

	Short term		Medium term	
	(1)	(2)	(3)	(4)
Meetings Only	0.018 (0.030) [-0.081, 0.045]	-0.000 (0.012) [-0.024, 0.025]	0.009 (0.023) [-0.058, 0.043]	-0.003 (0.014) [-0.029, 0.034]
Open defecation (group share, R4)		0.760*** (0.028)		0.504*** (0.046)
Share of households landless		0.050** (0.019)		0.046* (0.025)
Union FEs	Yes	Yes	Yes	Yes
Number of groups	377	377	377	377
Number of villages	31	31	31	31
Omitted category mean	0.150	0.150	0.084	0.084
Omitted category S.D.	(0.208)	(0.208)	(0.153)	(0.153)

Notes: the dependent variable is the share of households primarily practicing OD. Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment). Observations (groups) are weighted by the number of households. The sample consists of all villages. This table presents only the effect of the meetings-only treatment relative to pure controls; effects of the other treatments are reported in the main text. The sample sizes reported here are groups and villages in the meetings-only treatment and pure controls. The omitted category consists of groups in pure control villages. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

Table A6: Medium Term OD – Household Self-Report

	(1)	(2)
Meetings Only	-0.171* (0.089) [-0.050, 0.368]	-0.162* (0.087) [-0.051, 0.353]
Open defecation (group share, R4)		0.414*** (0.052)
Share of households landless		0.143*** (0.040)
Union FEs	Yes	Yes
Number of groups	377	377
Number of villages	31	31
Omitted category mean	0.469	0.469
Omitted category S.D.	(0.355)	(0.355)

Notes: the dependent variable is the share of households regularly practicing OD in the medium term (12-15 months after assessment). Observations (groups) are weighted by the number of households. The sample consists of all villages. This table presents only the effect of the meetings-only treatment relative to pure controls; effects of the other treatments are reported in the main text. The sample sizes reported here are groups and villages in the meetings-only treatment and pure controls. The omitted category consists of groups in pure control villages. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

B Robustness Checks for Main Outcomes of Interest

This appendix reports two sets of robustness checks for our estimates of treatment effects on the main outcomes of interest: hygienic latrine ownership in the short and medium term.

The first robustness check consists of re-estimating Equation 1 from the main text, but assigning each group equal weight (i.e., without weighting groups by the number of households). The estimates, reported in Table B1, are virtually unchanged from those of the main text (Table 3).

The second robustness check consists of specifications augmenting Equation 1 from the main text by interacting the treatment dummies with demeaned values of the control variables. As argued by Lin (2013) and Gibbons et al. (2019), the level (non-interacted) terms are a more robust estimator of the average treatment effect in the presence of heterogeneity with respect to the control variables. Specifically, we estimate

$$\begin{aligned}
 y_{gv} = & \sum_{t=0}^4 \beta_t \{\text{Treatment}_v = t\} \\
 & + \sum_{t=0}^4 \delta_t \{\text{Treatment}_v = t\} \times y_{0gv} + \sum_{t=0}^4 \gamma_t \{\text{Treatment}_v = t\} \times \text{ShareLandless}_{gv} \quad (\text{B-1}) \\
 & + \delta_L y_{0gv} + \gamma_L \text{ShareLandless}_{gv} \\
 & + \varphi_u + \varepsilon_{gv},
 \end{aligned}$$

where $t = 0, \dots, 4$ indexes treatments (PureControl, Incent, Cert, Priv, Publ), and each treatment is interacted with (demeaned values of) the control variables y_{0gv} and $\text{ShareLandless}_{gv}$. The coefficients β_t on the non-interacted treatment term represent average treatment effects. As in the main text, the common, meetings-only treatment is the omitted category so estimates are relative to that group.

We present results for our main outcome of interest, hygienic latrine ownership, in Table B2 and Figure B1. Here, we report the non-interacted coefficients (i.e., $\{\beta_t\}$ from Equation B-1), representing the average treatment effects; we discuss interactions in Section 5.2. The results are generally similar to those in the main text. The main difference to note is that the estimated difference between the short-run effects of the monetary reward and private commitment treatments has the same magnitude but is no longer significant at the 10% level ($p = 0.101$).

Table B1: Program Effects: Hygienic Latrine Ownership
Unweighted Regressions

Figure B1: Program Effects: Hygienic Latrine Ownership
Interact Treatment with De-Meaned Control Variables

(a) Short-term

(b) Medium-term

Notes: this graph presents estimated treatment effects of the interventions on the share of households in the group owning a hygienic latrine. Panel (a) presents effects in the short term (at the time of assessment); panel (b) in the medium term (12-15 months after assessment). The regression controls for the baseline level of the outcome variable, the share of households in the group that are landless, and union fixed effects. Following Lin (2013), the control variables are de-meaned and interacted with treatment indicators. This figure plots the non-interacted treatment coefficients, representing average treatment effects. Observations (groups) are weighted by the number of households. The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. 95% confidence intervals use standard errors clustered at the village level (the level of randomization).

C Estimated Effects on Secondary Outcomes

This appendix presents estimated treatment effects in the short- and medium-term on secondary outcomes of interest, namely:

- Hygienic Latrine Access: Table C1
- Any Latrine Ownership: Table C2
- Any Latrine Access: Table C3
- Open Defecation – Surveyor Assessment: Table C4
- Open Defecation – Household Self-Report: Table C5 (medium-term only)

The estimation equation is given by Equation 1 in the main text.

Omitted category mean	0.528	0.528	0.627	0.627
Omitted category S.D.	(0.218)	(0.218)	(0.278)	(0.278)

Notes: the dependent variable is the share of households in the group with access to a hygienic latrine. Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment). Observations (groups) are weighted by the number of households. The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

Notes: the dependent variable is the share of households regularly practicing OD in the medium term (12-15 months after assessment). Observations (groups) are weighted by the number of households. The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. Wild cluster bootstrap (9,999 repetitions, Webb weights) 95% confidence intervals, resampling at the village level, in brackets for the coefficients of interest. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

D Household Investments and Behaviors

In this appendix, we report full regression results the analysis of household behavior discussed in Section 5.2.1. In each case, we estimate a regression of the form

$$y_{hgv} = \beta_1 \text{Incent}_v + \beta_2 \text{Cert}_v + \beta_3 \text{Priv}_v + \beta_4 \text{Publ}_v + \delta \text{ShareOwnHygienic}_{0gv} + \gamma \text{ShareLandless}_{gv} + \beta_0 \text{PureControl}_v + \varphi_u + \varepsilon_{igv} \quad (\text{D-1})$$

where y_{hgv} is the outcome variable of interest (e.g., whether the household owns a latrine with an intact, properly installed slab) for household h in group g in village v , Incent_v and Cert_v are indicators for village v 's reward treatment assignment (financial incentive and social incentive, respectively), Priv_v and Publ_v are indicators for village v 's commitment treatment assignment (private commitment and public commitment, respectively), $\text{ShareOwnHygienic}_{0gv}$ is the pre-intervention share of households in group g owning a hygienic latrine, $\text{ShareLandless}_{gv}$ is the share of landless households in the group, φ_u is a set of union fixed effects, and ε_{igv} is an error term which may be correlated at the village level (the level of randomization).

Tables D1 and D2 present results on latrine components, specifically, whether the household owns a latrine with the corresponding component intact and properly installed. These tables correspond to the estimates presented in Figures 5b and 5b of the main text.

Tables D3 and D4 examine outcomes related to latrine maintenance. These estimates correspond to those presented in Figures 6a and 6b of the main text.

Table D5 shows the effects of the treatments on whether the household reported receiving advice, assistance, or pressure from others in the group. These estimates correspond to those presented in Figure 7 of the main text.

Table D6 shows the effects of the treatments on whether the household reported conflicts with neighbors over latrines. This outcome was only collected in the endline survey.

Notes: the dependent variable is an indicator for whether the household reports conflict with neighbors over latrines in the medium term (12-15 months after assessment). The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. Standard errors clustered at the village level. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

E Interaction with Household Characteristics

In this appendix, we report full regression results for our main outcome of interest (hygienic latrine ownership) interacting treatment indicators with household characteristics, as discussed in Section 5.2 of the main text. The regression equation is given by Equation 2 in the main text, which we reproduce here for convenience:

$$\begin{aligned} y_{hgv} = & \alpha_0 + \alpha_1 D_{hgv} \\ & + \sum_{p=0}^4 \beta_p \cdot 1 \{1\text{Treat}_v = p\} + \sum_{p=0}^4 \theta_p \cdot 1 \{\text{Treat}_v = p\} \times D_{hgv} \\ & + \delta y_{0gv} + \gamma \text{ShareLandless}_{gv} + \varphi_u + \varepsilon_{hgv} \end{aligned} \tag{2}$$

The estimates in Table E1 do not include any household characteristic D_{hgv} , and are included to show that regressions using household-level data are similar to those using group-level data as reported in the main text.

In Table E2, D_{hgv} is an indicator for whether the household is landless, a proxy for poverty. The estimates plotted in Figure 8 of the main text correspond to columns (2) (short-term) and (4) (medium-term) of this table.

In Table E3, D_{hgv} is a categorical variable for the household's latrine ownership status at baseline. The omitted category consists of households not owning any latrine at baseline. The estimates plotted in Figure 9 of the main text correspond to columns (2) (short-term) and (4) (medium-term) of this table.

F Interaction with Group Characteristics

In this appendix, we report full regression results for our main outcome of interest (hygienic latrine ownership) interacting treatment indicators with group characteristics, as discussed in Section 5.2.3.

First, in Table F1, we report estimates of Equation 3, interacting the reward treatments (monetary and certificate) with the group's distance to the nearest reward threshold above its baseline status. Columns (1) and (2) report short-term results and Columns (3) and (4) report medium-term results. Columns (2) and (4) correspond to the specification plotted in Figure 10 in the main text.

Second, in Table F2, we report estimates of Equation 5, interacting the treatments with the baseline share of households in the group owning a hygienic latrine. Columns (1) and (2) report short-term results and Columns (3) and (4) report medium-term results. Columns (2) and (4) correspond to the specification plotted in Figure 13 in the main text.

Finally, we report results from our ex-post exploratory analyses. Similar to equation 5 in the main text, we estimate

$$\begin{aligned}
 y_{gv} &= \alpha_0 + \alpha_1 D_{gv} & (F-1) \\
 &+ \sum_{p=0}^4 \beta_p \cdot 1 \{1\text{Treat}_v = p\} + \sum_{p=0}^4 \theta_p \cdot 1 \{\text{Treat}_v = p\} \times D_{gv} \\
 &+ \delta y_{0gv} + \gamma \text{ShareLandless}_{gv} + \varphi_u + \varepsilon_{gv}
 \end{aligned}$$

where D_{gv} is a characteristic of group g and all other variables are as defined in equation (5). As in equation (5), α_1 represents the level effect of characteristic D , the coefficient β_p represents the level effect of treatment p ,¹ and the coefficient θ_p is the interaction between treatment p and characteristic D .

We considered the following characteristics, which were relevant as proxies for resources available to the group, baseline sanitation status beyond hygienic latrine ownership, strength of potential epidemiological externalities, or group social cohesion:

- Share of landless households in the group (Table F3)
- Baseline ownership of any latrine (Table F4)
- Baseline ownership of non-hygienic latrines (Table F5)
- Whether the group contained an individual considered by others in the village to be a village leader (Table F6)
- Group size (number of households) (Table F7)
- Group density (the average number of households within 50m of each household in the group) (Table F8)

¹For discrete D , this is the effect of treatment p on groups in the reference category, i.e., with $D = 0$. For continuous D , as in in equation (5), we de-mean the interaction variable so β_p represents the effect of treatment p on groups with the mean level of D (Wainer 2000).

- Two social network statistics calculated using baseline data on household relationships within the village
 - Maximum eigenvalue of adjacency matrix, interpretable as the speed at which information will spread within the group (Table F9)
 - The second eigenvalue of the stochastized adjacency matrix, interpretable as how segregated a network is, i.e., negatively related to the extent to which information will spread within the group (Table F10)

Overall, we do not find strong evidence of an association between these variables and the size of our estimated treatment effects. There is a weak negative association between the share of landless household in the group and the effectiveness of the monetary reward treatment, although only in the short term (Table F3). Contrary to our expectation, the presence of a village leader in a group is negatively associated with the effectiveness of the monetary reward and reward certificate treatments, although again only in the short term (Table F6). The effectiveness of the monetary reward treatment is negatively associated with the network segregation measure, once again in the short term only (Table F10). Given the large number of hypotheses tested and the relatively low power to detect interactions, we view these results as suggestive only.

Table F1: Program Effects: Hygienic Latrine Ownership
Interacted with Distance to Reward Threshold

	Short term		Medium term

Omitted category S.D.	(0.175)	(0.175)	(0.258)	(0.258)

Notes: the dependent variable is the share of households in the group owning a hygienic latrine Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment).. Interactions with distance to threshold are estimated for the reward treatments (monetary reward, recognition reward). The thresholds were not relevant for the commitment treatments, so no interaction is estimated. Distance to threshold is de-meanded, so the level terms represent the effect of treatment at the mean value of distance to threshold (15.8 percentage points). Observations (groups) are weighted by the number of households. The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. Groups above the higher threshold for their union are dropped. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

Notes: the dependent variable is the share of households in the group with a hygienic latrine. Columns (1) and (2) report short-term effects (at the time of assessment); columns (3) and (4) report medium-term effects (12-15 months after assessment). Observations (groups) are weighted by the number of households. The comparison group consists of groups that received the meetings only treatment. Pure control villages are included as a separate category to enhance precision. Standard errors clustered at the village level. Standard errors clustered at the village level in parentheses. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.

G Single Treatment Villages and Fully Interacted Model

In this section, we present (1) estimates using only the single-treatment villages and (2) fully interacted factorial specifications.

G.1 Single-Treatment Village Estimates

Here, we restrict attention to the villages receiving only one of the treatments (monetary reward, reward certificate, private commitment, public commitment), plus the meetings-only and pure control villages. These correspond to cells A (meetings only), B (private commitment, no reward), C (public commitment, no reward), D (monetary reward, no commitment), G (reward certificate, no commitment), and J (pure controls) from Table 1. In other words, we estimate Equation 1 from the main text but drop villages receiving combined treatments, specifically cells E (monetary reward, private commitment), F (monetary reward, public commitment), H (reward certificate, private commitment), and I (reward certificate, public commitment) from Table 1.

We present the results for the main outcomes of interest, short-term and medium-term hygienic latrine ownership, in Table G1 and Figure G1. The results are noisier, as expected, but generally comparable to those using the full sample. The relative magnitudes of point estimates are the same – in the short term, the point estimate for monetary reward is largest, followed by public commitment; in the medium term, the point estimate for public commitment is largest – and the confidence intervals around each estimate from this restricted sample overlap with those from the full sample. However, the absolute magnitudes of these point estimates are smaller, suggesting some complementarity between treatments.

G.2 Fully Interacted Model

Here, we estimate a fully interacted model, augmenting Equation 1 with separate indicators for each treatment cell.

The estimates are presented in Table G2 and Figure G2. As with the results of Section G.1, there is suggestive evidence of positive interaction effects, although as expected the estimates are imprecise. Specifically, in the short term, the combination of the monetary reward and the public commitment treatment is larger than either of these treatments alone, and these differences are both economically meaningful and statistically significant ($p < 0.01$). However, this relationship does not hold into the medium term, when the combination of monetary incentive and public commitment does no better than the public commitment alone. Interestingly, in the medium term, the point estimate for the combination of public commitment and reward certificate (i.e., non-monetary reward) is greatest, which is consistent with the mechanism of signalling and reputation we discuss in the main text. However, given the imprecision of our estimates for individual cells, we view this only as suggestive.

Figure G1: Program Effects: Hygienic Latrine Ownership
Single Treatment Villages

(a) Short-term

(b) Medium-term

Notes: this graph presents estimated treatment effects of the interventions on the share of households in the group with a hygienic latrine. Panel (a) presents effects in the short term (at the time of assessment); panel (b) in the medium term (12-15 months after assessment). The regression controls for the baseline level of the outcome variable, the share of households in the group that are landless, and union fixed effects. Observations (groups) are weighted by the number of households. The sample includes villages that received only one treatment, plus meetings-only villages and pure controls. Meetings-only villages are the omitted category. Pure control villages are included for enhanced precision. 95% confidence intervals use standard errors clustered at the village level (the level of randomization).
